- NOTES :
1. The crane strength rated lifting capacity are based on the crane strength only.  
The empty chassis rated lifting capacity are based on the crane strength and vehicle stability (no load on the truck bed) when the crane is set level on firm level ground.
  2. The mass of the hook (95 kg), slings and all similarly used load lifting devices must be added to the mass of the load.
  3. If the boom length of your machine exceeds the length listed in this table little, select the table corresponding to the next longer boom.
  4. 10.05 m boom means  $\sphericalangle$  mark on 3rd boom section side plate is half seen.
  5. When the lifting load is heavier than 6,000kg, number of part lines must be 8. In case of 6,000kg or less, number of part lines must be 4. Load per line must not surpass 14.7kN{1,500kgf}.
  6. When the outriggers are extended to the middle width, read the capacities rated for the minimum extension width.
  7. This load radius shows actual load radius which includes boom deflection.
  8. Empty Chassis Rated Capacities table A and D depend on the types of chassis.
  9. Empty Chassis Rated Capacities are shown for over-side areas and over-rear area. These capacities for over-front area may be lowered depending on the types of chassis.

(The following table shows guidelines for bodywork vehicles that can achieve the rated lifting capacities tables A and D. Be sure to carry out a stability inspection to determine which performance to apply.)

A	WB : 5000mm over, GVW : 25t over, CAWf (*1) : 3.0t over
D	WB : 5000mm over, GVW : 25t over, CAWf (*1) : 4.0t over

\*1 Chassis front axle weight (excluding crane mass)

### WORKING RANGE

NOTE: The above lifting heights and boom angles are based on a straight (unladen) boom, and allowance should be made for boom deflection obtained under laden conditions.
